

# Azure DevOps Test Case Creator

*Spreadsheet-driven workflow — create new test cases, skip existing ones*

## If Test Case ID is present

Skip the row — no ADO call, the existing ID is kept as-is.

## If Test Case ID is empty

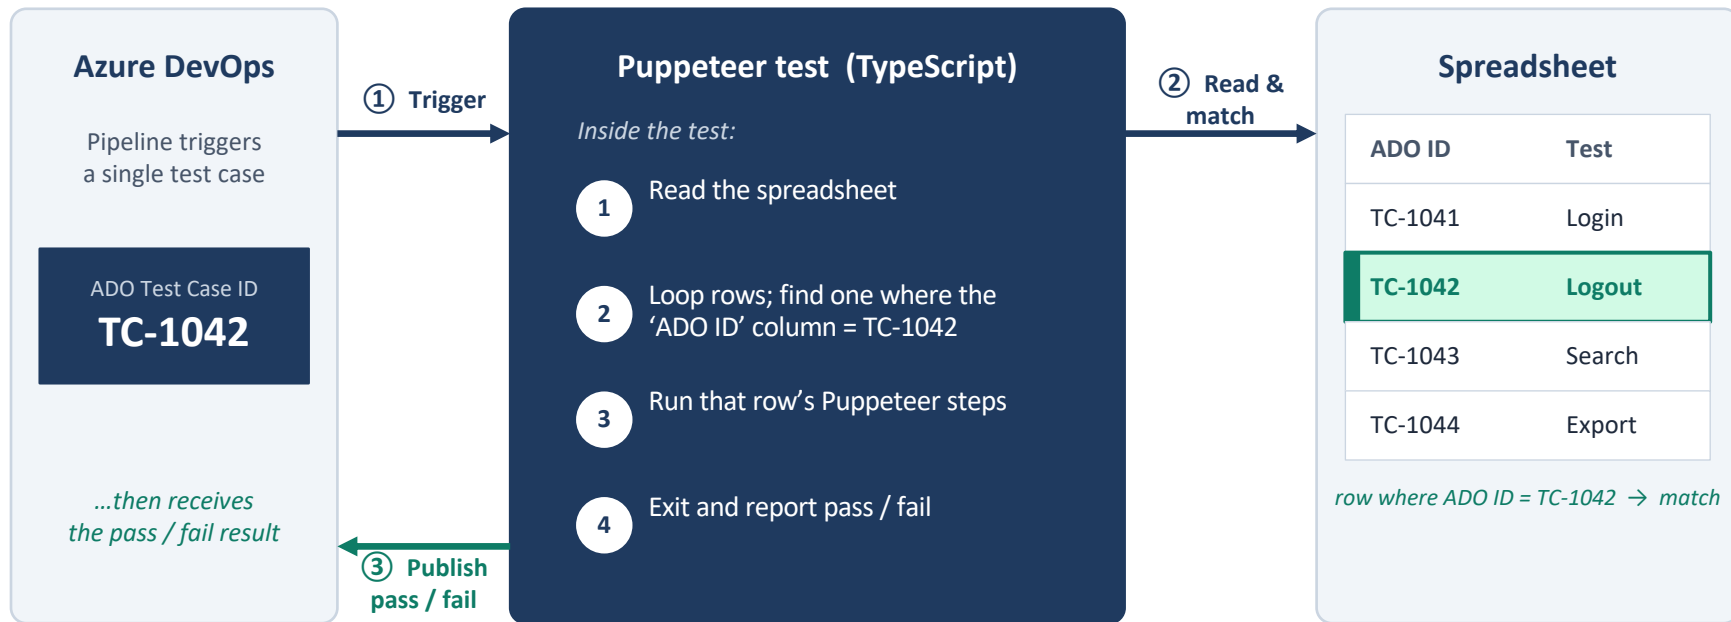

Create the test case in ADO, then write the new ID back to the row.

## Sample run

| # | Test name                      | Test Case ID  | Action                |
|---|--------------------------------|---------------|-----------------------|
| 1 | Login with valid credentials   | TC-1001       | Skip — already exists |
| 2 | Login with invalid credentials | TC-1042 (new) | Created in ADO        |
| 3 | Logout from dashboard          | TC-1019       | Skip — already exists |
| 4 | Password reset flow            | TC-1043 (new) | Created in ADO        |

# Test Execution & Result Publishing

*One shared spreadsheet — each ADO test self-selects its row by matching ADO ID*

*Pattern: one shared spreadsheet for all test cases — each ADO test stays a thin wrapper that locates its own row.*
